

The 24-Hour Dispo System

Your deal + your CRM + InvestorBase + Claude = the best 100 buyers for any deal.

The old way: blast the whole list, wait, cut the price. **This way:** rank the list against *this* deal, work it in order, and open every message with the buyer's own prior purchase. Same list. Different order. Contract inside the offer window.

SET UP ONCE — 2.5 hours, then never again. ① InvestorBase account, search geography saved. ② In your CRM: build the dispo pipeline template, the tag structure, and the 12 custom fields (§4). Do this before your first import or the CRM drops the columns silently. ③ Save the ranking prompt (§2) as a Claude Project. ④ Confirm your title company has closed an assignment before.

THE RUN — 4.5 hours, one day

#	Do this	Time	You get
1	Fill the deal outline (§5). Verify square footage against a second source — public record is wrong often and by hundreds of feet. It corrupts the ranking and then the listing.	45m	Deal outline
2	InvestorBase: subject as center, 24-month window. Widen the radius until you clear 100+ buyers . Record the radius. Wider = more volume, less relevance — the ranking re-sorts for it.	15m	Buyer pool
3	Export to CSV. Confirm purchase addresses, dates and prices survived. Contact-only export = no ranking. Re-export if they didn't.	5m	Raw export
4	Run the ranking prompt (§2). Paste the outline in full , attach the CSV. Review the A tier before you import anything.	30m	Ranked CSV + buyer PDF
5	Publish the listing — [10X LISTING WORKFLOW]. Live before Step 7 . All three touches point at it.	—	Listing URL
6	Import to the CRM. Opportunity Value = fit score , so the board sorts itself into the call list. Map in §4.	20m	Sorted pipeline
7	Hour 1 — SMS, Tier A only. Opens with their prior purchase. Asks for two minutes, not a decision.	25m	Touch 1
8	Hour 2 — Email, one per buyer. Plain text, 3–6 lines, no formatting. References the text.	45m	Touch 2
9	Hour 4 — Call the top 20% of the full ranked list, in order. Voicemail names the text <i>and</i> the email.	90m	Touch 3

Templates for 7, 8 and 9 are in §3. Budget another 2–3 hours the same day for inbound — if the ranking worked, they call back while you're still dialing.

AFTER DAY 1

Cadence. Day 2 AM: one pattern-interrupt text to A-tier non-responders. Day 2 midday: run the full sequence on Tier B. Day 2 PM: second dial to A, no voicemail. Day 3: A-tier at five touches with zero response moves to nurture — keep their durable tags, stop dialing. Tier C gets the standard blast. Full table in §6.

Inbound. One named person owns the line for all of day one. Solo? Stop dialing when inbound starts. Ask in this order: seen the listing → what have you closed like this → how are you funding it → when can you walk it → what number gets it done. Price is fifth on purpose. Script in §3.

Stop rule. The list is exhausted when **two** of these are true: A tier through five touches with no replies · three or more buyers naming the **same** objection · you're dialing below the top 40% · two walkthroughs and no offer. Then it's a price change or a wider radius — not more dials. Detail in §6.

Keep the list. Within a week of closing, promote the durable tags (`scope-gut` , `fin-cash` , `buys-[submarket]`), record who responded and who objected to what, and append to one master buyer file. Deal two costs three hours. Deal ten costs one.

IF SOMETHING BREAKS, GO HERE — §2 The ranking prompt, Claude and ChatGPT · §3 Every template and script · §4 CRM fields, tags, import map · §5 Deal outline fields + pre-launch checklist · §6 Failure modes, tier gates, cadence, stop rule, post-close · §7 Video walkthrough outline

§2 — THE RANKING PROMPT

What it does: scores every buyer in your export across seven weighted dimensions, gates them into three tiers, and writes per-buyer outreach copy for the top tier. **Weights:** scope/product-type match **30** · price-band match **20** · proximity **15** · purchase count and recency **15** · financing **10** · systems (well/septic) **5** · vintage **5**.

The one instruction you must not delete: scope is weighted double proximity. Distance is the cleanest, most sortable field in the file, and a model left alone will quietly let it dominate — producing a beautiful ranked list of people who happen to live nearby. A gut buyer forty minutes away beats a light-rehab buyer four minutes away. Every time.

Fill the eight bracketed fields, all in the first block. Paste the deal outline in full — not a summary.

Claude version

You are ranking a cash buyer list against one specific off-market deal for a wholesaler running a 24-hour dispositions sequence. Your output determines the order in which real people get called today. Precision matters more than completeness.

=====

INPUT 1 – THE DEAL

=====

[PASTE YOUR FULL DEAL OUTLINE HERE – ALL FIELDS, NOT A SUMMARY]

Search radius used to build the buyer list: [INSERT RADIUS IN MILES]
Offer deadline: [INSERT DATE AND TIME]
My name: [INSERT] My callback number: [INSERT]
Title company: [INSERT] Listing URL: [INSERT]

=====

INPUT 2 – THE BUYER LIST

=====

The attached CSV is an InvestorBase export of cash buyers who closed transactions within [INSERT RADIUS] miles of the subject over the trailing 24 months. Each row is a buyer with purchase history attached.

=====

SCORING – SEVEN DIMENSIONS, 100 POINTS

=====

1. SCOPE / PRODUCT-TYPE MATCH – 30 points
Classify each buyer's history into a scope class using purchase price relative to area value, property characteristics, year built, and any condition or remarks data present:
 GUT – deep-discount, distressed stock, heavy renovation
 MEDIUM – meaningful discount, systems and cosmetic work
 LIGHT – modest discount, cosmetic and turn work
 TURNKEY – at or near market, rent-ready or retail
Score their class against THIS deal's class. Exact match full. One class away partial. Two or more classes away near zero – a turnkey rental buyer is not a buyer for a gut, no matter how close they live.
2. PRICE-BAND MATCH – 20 points
Score against BOTH numbers: does their history bracket the buy-it-now price, and does it show exits or holds in the ARV range. Measure the overlap between their demonstrated band and this deal's band.
3. PROXIMITY – 15 points
Distance to their NEAREST prior purchase, on a curve calibrated to the [INSERT RADIUS]-mile radius. Use the export's distance field where present.
4. PURCHASE COUNT AND RECENCY – 15 points
Trailing 12-month count weighted roughly double the 24-month count. Four purchases last year outranks eight that closed 20 months ago.
5. FINANCING TYPE – 10 points
Cash highest, hard money close behind, conventional materially lower.
Where absent: neutral mid-value, tag fin-unknown, and FLAG it as imputed.
Never infer financing from purchase price alone.
6. SYSTEMS MATCH – 5 points
Well/septic experience where the subject has well/septic. If the subject is on public utilities this is neutral for everyone – do not use it to manufacture separation.
7. VINTAGE MATCH – 5 points
Era overlap between the subject's year built and their purchase history.

=====

CRITICAL WEIGHTING INSTRUCTION – DO NOT SOFTEN THIS

=====

SCOPE MATCH IS WEIGHTED DOUBLE PROXIMITY, DELIBERATELY.
A gut-rehab buyer forty minutes away BEATS a light-rehab buyer four minutes away. Wrong scope is a wrong buyer; distance is only a drive.
You will be tempted to over-index on proximity because distance is the

cleanest and most sortable field in this dataset. Do not. Before you output, check whether your A tier is essentially ordered by distance. If it is, you have made the error this instruction exists to prevent. Fix it.

=====

TIERS – GATES FIRST. SCORE ONLY ORDERS WITHIN A TIER.

=====

TIER A – must pass ALL FOUR:

- (1) SCOPE A prior purchase in this deal's scope class, or one adjacent
- (2) PRICE A prior purchase priced between [buy x 0.5] and [ARV x 1.25]
- (3) RECENCY At least one purchase closed in the trailing 12 months
- (4) SCORE Composite 70 or above

TIER B – passes the scope gate OR the price gate, has a purchase in the trailing 24 months, and scores 45 to 69 inclusive.

TIER C – everything else not excluded.

EXCLUDED, with the reason stated: no purchase in 24 months; entire history two or more scope classes away; new-construction-only, commercial-only, land-only, or institutional/iBuyer volume purchasing; no phone and no email.

State every gate result per buyer as pass/fail so the tiering reproduces across runs. DO NOT PAD TIER A. If six buyers pass, Tier A has six buyers – report the count plainly and say the pool may need a wider radius.

=====

RULES OF ENGAGEMENT

=====

- 1. Flag every assumption inline, on that buyer's row – not in a footnote.
- 2. Never source property facts from public record or your own knowledge when I have supplied them. My deal outline is authoritative for square footage, beds, baths, systems, lot size and year built. Note conflicts; do not resolve them in favor of the CSV.
- 3. State, in one paragraph at the top, which missing input would most change this ranking and what it would move.
- 4. Do not pad any tier to reach a number.
- 5. If a required column is missing, say so before scoring and tell me what will be degraded. Do not silently substitute.

=====

OUTPUT 1 – RANKED CSV, best to worst, CRM-native headers

=====

First Name, Last Name, Phone, Email, Company Name, Address, City, State, Postal Code, Tags, buyer_tier, buyer_rank, fit_score, call_priority, prior_deals_24mo, prior_deals_12mo, nearest_prior_address, nearest_prior_distance_mi, nearest_prior_price, nearest_prior_date, scope_class, scope_evidence, price_band_match, financing_type, systems_match, vintage_match, why_this_fits, assumptions_flagged

Tags: semicolon-delimited, lowercase, hyphenated –
dispo-[address-slug]; tier-[a/b/c]; scope-[class]; band-[match/near/out];
fin-[cash/hard-money/conventional/unknown]; radius-[n]mi; buys-[submarket]

call_priority is the literal dial order, 1 through N.
why_this_fits is ONE sentence naming their specific prior deal, readable aloud as a call opener with no editing.
Every evidence count must be a real number from the data, not an estimate.

=====

OUTPUT 2 – COMPREHENSIVE PDF

=====

- Everything in the CSV, plus a one-page profile for EVERY Tier A buyer:
- Their nearby past deals NAMED INDIVIDUALLY: address, date, price, distance, characteristics. The addresses, not "3 purchases within 5 miles"
 - Why this deal fits their demonstrated pattern, tied to those deals
 - The honest counter-case: why it might not fit, one or two lines
 - SMS under 300 characters naming their prior purchase
 - Email: plain text, 3-6 short lines, one-to-one voice, no formatting, no marketing structure, references the SMS sent an hour earlier, includes the listing URL, the comp link, and both phone numbers
 - Cold-call opener and voicemail, written to be spoken

Open with a summary page: tier counts, the thinnest part of the pool, the missing input from Rule 3, and any data-quality problems in the export. Show me the summary and tier counts first, then ask before generating the full per-buyer profiles.

ChatGPT version

Same scoring, same gates, restructured for how ChatGPT handles long instructions and files. Upload the CSV first, then paste.

ROLE: You are a dispositions analyst ranking a cash buyer list against one specific off-market deal. Your ranking sets the order in which real buyers get called today.

Work in phases. Do not skip ahead.

PHASE 1 – Read the deal and the CSV. Report data quality. Stop.

PHASE 2 – Score and tier every buyer. Output the CSV. Stop.
PHASE 3 – On my confirmation, produce the per-buyer profiles.

--- THE DEAL ---

[PASTE YOUR FULL DEAL OUTLINE HERE – ALL FIELDS, NOT A SUMMARY]
Search radius used: [INSERT RADIUS IN MILES]
Offer deadline: [INSERT DATE AND TIME]
My name: [INSERT] My callback number: [INSERT]
Title company: [INSERT] Listing URL: [INSERT]

--- THE DATA ---

The uploaded CSV is an InvestorBase export: cash buyers with closed transactions within [INSERT RADIUS] miles of the subject over 24 months, with purchase history attached. Use the Python tool for the counting, distance handling and banding. Do not eyeball the numbers.

--- PHASE 1: DATA QUALITY (then stop) ---

Report row count, and which of these are present and populated: buyer entity, contact name, phone, email, mailing address, purchase addresses, purchase dates, purchase prices, property characteristics, distance from subject, financing type. Say what scoring is degraded by anything missing. Then stop.

--- PHASE 2: SCORING, 100 POINTS ---

1. SCOPE / PRODUCT-TYPE MATCH 30 Classify each buyer's history as GUT, MEDIUM, LIGHT or TURNKEY from purchase price vs. area value, property characteristics, year built and any condition data. Score against THIS deal's class. Exact full, one class away partial, two or more near zero. A turnkey rental buyer is not a buyer for a gut.
2. PRICE-BAND MATCH 20 Against both the buy price and the ARV. Measure band overlap.
3. PROXIMITY 15 Nearest prior purchase, on a curve calibrated to the [INSERT RADIUS]-mile radius.
4. PURCHASE COUNT AND RECENCY 15 12-month count weighted ~2x the 24-month count.
5. FINANCING TYPE 10 Cash highest, hard money close behind, conventional materially lower. Absent = neutral, tag fin-unknown, flag as imputed. Never infer financing from price.
6. SYSTEMS MATCH 5 Well/septic where the subject has them. Neutral for all if public utilities – do not manufacture spread.
7. VINTAGE MATCH 5 Era overlap.

*** WEIGHTING – DO NOT SOFTEN ***

Scope is double proximity on purpose. A gut buyer forty minutes away BEATS a light-rehab buyer four minutes away. Distance is the cleanest field in this file and you will be tempted to let it dominate. Before you output, check whether your A tier is essentially sorted by distance. If it is, fix it.

--- TIERS: GATES FIRST, SCORE ONLY ORDERS WITHIN A TIER ---

TIER A passes all four: (1) prior purchase in this deal's scope class or one adjacent; (2) prior purchase priced between [buy x 0.5] and [ARV x 1.25]; (3) a purchase closed in the trailing 12 months; (4) score >= 70.
TIER B passes the scope gate OR the price gate, has a purchase in 24 months, scores 45-69.
TIER C is everything else not excluded.
EXCLUDED, reason stated: no purchase in 24 months; history two or more scope classes away; new-construction-only, commercial-only, land-only or institutional volume buyers; no phone and no email.
Report gate results per buyer as pass/fail so the tiering reproduces exactly. DO NOT PAD TIER A. If six qualify, output six and say so.

--- RULES ---

Flag every assumption inline on the buyer's row. My deal outline is authoritative – never override my property facts with public record or your own knowledge; note conflicts. State in one paragraph which missing input would most change this ranking. Do not pad any tier. If a required column is missing, say so before scoring rather than substituting.

--- PHASE 2 OUTPUT: DOWNLOADABLE .CSV ---

Ranked best to worst, columns exactly:
First Name, Last Name, Phone, Email, Company Name, Address, City, State, Postal Code, Tags, buyer_tier, buyer_rank, fit_score, call_priority, prior_deals_24mo, prior_deals_12mo, nearest_prior_address, nearest_prior_distance_mi, nearest_prior_price, nearest_prior_date, scope_class, scope_evidence, price_band_match, financing_type, systems_match, vintage_match, why_this_fits, assumptions_flagged
Tags semicolon-delimited, lowercase, hyphenated: dispo-[address-slug]; tier-[a/b/c]; scope-[class]; band-[match/near/out]; fin-[type]; radius-[n]mi; buys-[submarket]
call_priority is the literal dial order. why_this_fits is ONE sentence naming their specific prior deal, readable aloud as a call opener. Then stop.

--- PHASE 3 (after I confirm): PDF ---

Everything in the CSV plus a one-page profile for EVERY Tier A buyer: their nearby past deals named individually with address, date, price, distance and characteristics; why this deal fits their pattern; the counter-case in one or two lines; an SMS under 300 characters naming their prior purchase; a plain-text email of 3-6 short lines in one-to-one voice referencing the SMS, with listing URL, comp link and both phone numbers; and a cold-call opener and voicemail written to be spoken. Lead with a summary page: tier counts,

the thinnest part of the pool, the missing input, and data-quality problems.

Re-run the ranking any time you change the price. The price gate is defined off the buy number — a price cut moves the band, which moves who qualifies. Working the old ranking after a price change is working a list built for a different deal.

§3 — TEMPLATES

{{variables}} map to the CRM fields in §4. Populate them on import and these fill themselves.

Copy rules for all of them: no taglines, no slogans, straight factual language. Never call a rehab “cosmetic” unless it is; never say “full rehab” — describe the remaining work and let them scope it at walkthrough. No rehab estimates, all-in assumptions or yield math — ARV, price and rent only. Always include the comp link when one exists. Baltimore City deals: no neighborhood names, use the street address.

SMS — Touch 1, Hour 1

{{first_name}} – {{my_first_name}} here. Saw you picked up {{nearest_prior_address}} back in {{nearest_prior_date}}.

Got one about {{nearest_prior_distance_mi}} miles from it, {{subject_address}}, off market.

Worth 2 minutes on the phone? {{listing_url}}

Multiple nearby purchases:

{{first_name}} – {{my_first_name}}. You've bought {{prior_deals_12mo}} in this pocket in the last year, {{nearest_prior_address}} most recently.

Have one off market at {{subject_address}}. Same kind of project.

Got 2 minutes today? {{listing_url}}

Distant buyer, strong scope match — this is the one people skip. Don't:

{{first_name}} – {{my_first_name}}. You did {{nearest_prior_address}}, which is the same scope as one I just picked up at {{subject_address}}.

Not your usual pocket but it's your usual project.

Worth a look? {{listing_url}}

Under 300 characters. Never open with the deal — open with their purchase. Ask for two minutes, not a decision. Send from a number a human answers, staggered over 15-20 minutes.

Email — Touch 2, Hour 2

Subject: the address. Nothing else.

{{first_name}} –

Sent you a text earlier, following up here.

You bought {{nearest_prior_address}} in {{nearest_prior_date}}.
{{why_this_fits}}

{{subject_address}}. {{beds}}/{{baths}}, {{sqft}} sf, {{price}}.
ARV {{arv}}. {{scope_remaining}}.

Full details and photos: {{listing_url}}
Comps: {{comp_link}}

Showings this week, offers due {{deadline}}.

Call or text me at {{my_cell}} – I have you at {{their_cell}}.

{{my_first_name}}

Do	Don't
Plain-text send, individually	The drag-and-drop email builder
3-6 short lines	Paragraphs, bullets, bold, headers
Their address in line three	Header image, logo, banner
Both phone numbers in the body	Signature block with icons
Address as the subject	“New Investment Opportunity — 22% Below ARV”

The test: hold it next to an email you actually typed on your phone to a buyer you know. Not the same species of message? Rewrite it.

Cold-call opener — Touch 3, Hour 4

"{{first_name}}? {{my_full_name}}, Impact Home Team – you got a minute?

Reason I'm calling: you bought {{nearest_prior_address}} back in {{nearest_prior_date}}. I've got one about {{nearest_prior_distance_mi}} miles from that, off market, {{subject_address}}.

{{why_this_fits}}

Sent you a text this morning and an email an hour ago – didn't want to just leave it in your inbox.

You still buying in that pocket?"

Then stop talking. The next thing said comes from them. If they say “send me the info,” it’s already in their inbox — say so, and ask what would make it a fit.

Voicemail

"{{first_name}}, {{my_full_name}} with Impact Home Team, {{my_cell}}.

Calling about an off-market property at {{subject_address}} – about {{nearest_prior_distance_mi}} miles from {{nearest_prior_address}}, which I know you bought in {{nearest_prior_date}}.

{{beds}}/{{baths}}, {{sqft}} square feet, asking {{price}}, ARV around {{arv}}.

I texted you this morning and sent an email about an hour ago, so it's all in there – photos, comps, scope.

Offers are due {{deadline}}. {{my_cell}}. Thanks {{first_name}}."

Under 30 seconds. Number at the front and the end. Name both prior touches — that reference is what makes this the callback-generating touch instead of the third ignored message. No second voicemail inside 48 hours.

Inbound qualifying script

"This is {{my_first_name}} – thanks for calling back. Which property, {{subject_address}}?"

1. "Have you had a chance to look at the listing yet, or do you want me to walk you through it?"

2. "What have you closed recently that's similar to this one?"
→ If this contradicts the ranking, the ranking is wrong about this person. Fix the record while they're talking.

3. "How are you funding this one – cash, hard money, or a lender?"
→ A close-date question, not a credit question. Ask it that way.

4. "When can you walk it? I've got {{showing_windows}}."
→ The showing commitment is the actual qualification. Everything before this is conversation.

5. "What number gets this done for you today?"
→ Last. A caller asked for price in the first thirty seconds invents a low anchor to protect themselves, and now you're negotiating against a number they made up before they understood the deal.

"Offers are due {{deadline}}. If you want it, get me a signed contract and your deposit to {{title_company}} and it's yours – I'm signing the best terms on the table, not the highest number."

Log every answer while you’re on the call. There is no after on day one.

Offer comparison sheet

	A	B	C
Buyer entity			
Tier and rank			
Price			
Deposit — amount, and hard when?			
Funding: cash / hard money / conventional			
Proof of funds received and dated			
Inspection period (days)			

Close-by date			
Have they walked it?			
Contingencies beyond inspection			
Prior closes with you			
Prior closes in this submarket			
Assignment or double close			
Contract changes requested			
Net to you			
Close probability — high / med / low			

The bottom two rows are the decision; price is an input to it. A hard deposit and a short inspection from a buyer with prior closes in this submarket beats a bigger number from a first-timer with a 14-day inspection and no proof of funds. **Tell the losing buyers the same day, in a sentence, and tell them what won.** Cheapest relationship investment in the whole system, and it's why they answer next time.

§4 — CRM SETUP

One-time build. Do it before your first import — unmapped columns are dropped silently.

Pipeline: Dispo – [SUBJECT ADDRESS] , one per deal. Stages: Ranked-Not Contacted → Touch 1 Sent → Touch 2 Sent → Touch 3 Sent → Engaged → Showing Scheduled → Offer Received → Under Contract → Dead/Nurture.

Opportunity name: [BUYER ENTITY] – [SUBJECT ADDRESS] . The property address lives on the contact record and won't show on the card, which is exactly when you need it.

Opportunity Value = fit score (0-100). Not a dollar figure — a sort key. The board sorts by value, so the pipeline *is* the ranked call list. Anyone who opens it works top-down without being told to.

Twelve custom fields: buyer_tier · buyer_rank · fit_score · call_priority · prior_deals_24mo · prior_deals_12mo · nearest_prior_address · nearest_prior_distance_mi · nearest_prior_price · nearest_prior_date · scope_evidence · why_this_fits

Tags:

Tag	Example	Purpose
dispo-[address-slug]	dispo-412-oak-st	Everyone on this deal
tier-a / tier-b / tier-c		Drives every segmented send
scope-gut / -medium / -light / -turnkey		Durable. The most reusable tag you'll build
band-match / -near / -out		Price band fit
fin-cash / -hard-money / -conventional / -unknown		Durable. Financing evidence
radius-[n]mi	radius-4mi	Distance bucket
buys-[submarket]	buys-dundalk	Durable. Compounds across deals
touch1-sent / touch2-sent / touch3-sent		Applied by automation, not import

Import map: First/Last Name, Phone, Email, Company Name, Address block and Tags go to the standard fields — Tags semicolon-delimited. The twelve columns above map to the twelve custom fields of the same name. Then set Pipeline, Stage = Ranked-Not Contacted, Opportunity Value = fit_score , Source = Dispo Rank – [SUBJECT ADDRESS] . Confirm every mapping on the preview screen, every time.

§5 — DEAL OUTLINE + PRE-LAUNCH CHECKLIST

Required fields — no blanks before Step 2

Address · buy-it-now price · ARV · % of ARV · above-grade SF · basement SF (finished and unfinished separately) · total under roof · beds · baths (full and half separately) · lot size · year built · water source (well: depth, last test) · sewer (septic: tank age, last pump, inspection status) · outbuildings with condition · road surface, public or private, frontage, who maintains · scope completed · scope remaining · terms (assignment or double close, deposit, inspection period, close-by date) · title company and contact · showing availability · offer deadline to the minute · comp link

On square footage. Public record is wrong often, and when it's wrong it's frequently off by hundreds of feet — missed additions, finished basements counted above grade, decades-old data, some jurisdictions never measured at all. Two failure paths: in the ranking, SF feeds product-type and price-band scoring, so a 1,900 SF house entered as 1,400 gets scored against the wrong buyer cohort and you have no way to see it. In the listing, a buyer who walks a house 400 feet smaller than advertised doesn't renegotiate — they leave, and they discount everything else you told them. Verify against the tax record *and* an appraisal, a prior MLS listing with measured SF, or a physical measurement. Where sources disagree, state both with the source named and let the discrepancy be visible.

Pre-launch checklist — nothing unchecked before the hour-one text

Deal — ☐ every field above filled ☐ SF verified against a second source ☐ scope honest, no “cosmetic,” no “full rehab” ☐ title company confirmed and reachable today ☐ deadline set to the minute ☐ comp link live and correct

Data — ☐ subject as search center ☐ result count above 100 ☐ radius recorded ☐ export opened and verified: purchase addresses, dates, prices all present

Ranking — ☐ outline pasted in full, not summarized ☐ all bracketed fields filled ☐ A tier scope-checked ☐ assumptions flagged ☐ missing input named ☐ A tier not padded

Listing — ☐ published and clicked by you on a phone ☐ comp link works ☐ photos loaded

CRM — ☐ all twelve custom fields exist ☐ preview confirms every mapping ☐ Opportunity Value populated ☐ board sorts highest first ☐ inbound owner named in writing, phone set to receive

§6 — REFERENCE

Failure modes, by step

Step	What goes wrong	What it costs	Fix
1	Proceeding with fields blank because “the buyer will ask”	They ask at hour four, live, while deciding whether you’re organized enough to close	Fill it once, 45 minutes
1	Trusting public-record square footage	Corrupts the ranking <i>and</i> the listing. The most expensive error in the system	Verify against a second source
2	Stopping at exactly 100	The gates don’t care how close you were to the floor. A thin A tier follows	Widen one more increment
2	Widening the radius, then working the list in export order	The radius creates the pool; the ranking creates the order	Never confuse the two
3	Exporting a “contacts” view instead of a “transactions” view	Looks like a buyer list. Cannot be ranked. Most platforms default to it	Re-export with history
4	Accepting the first output because it looks organized	A ranked list is persuasive by construction. This is where you catch a distance sort	20 minutes of review, every time
5	Texting before the listing is live	Your best buyer clicks in the first ninety seconds. That’s what makes them your best buyer	Publish first, always
6	Importing before the custom fields exist	CRM drops them silently. You find out at hour one with 140 empty records	Build fields once, confirm preview every time
7	Merging a name into one generic text	“Hey Mike” is not personalization. The prior-purchase reference is the entire mechanism	Use the <code>why_this_fits</code> field
8	Building it in the email designer because it’s faster	Tracking pixel, footer, wrapper table → Promotions tab → the exact blast this replaces	Plain text
9	Compressing the schedule and calling at hour two	The voicemail can’t reference an email that hasn’t been sent. You lose the stacking effect	Hold the four-hour gap
Day 2+	Re-blasting the A tier because the deal hasn’t sold	They heard you five times. A sixth subtracts credibility for the next deal	Go to the stop rule
Post-close	Archiving the pipeline without harvesting it	Campaign data has no owner and no deadline, so it disappears	Calendar the 45 minutes the day it closes

Why 100 buyers is the floor

After the gates, a typical export loses most of its rows — no purchase in the window, wrong product class, outside every price band. A 60-buyer export routinely produces an A tier of two or three names. Two or three names isn’t a channel, it’s a coincidence, and a same-day three-touch sequence has nothing to run on. At 100+, the A tier is thick enough to work.

If the A tier still comes back thin, that’s information, not a problem to solve by loosening the gates. It means the radius was too tight, the scope class is unusual for this submarket, or your price band doesn’t overlap what people here actually buy. All three are worth knowing on day one instead of day four.

Cadence — day 2 to the deadline

When	Who	Action
Day 2 AM	Tier A, no reply	One SMS. Pattern interrupt, one line — what held them back, or is it outside their box. Not a re-pitch
Day 2 midday	Tier B	Full three-touch sequence compressed into one day; calls to the top half of B
Day 2 PM	Tier A, no reply	Second dial, different time of day. No voicemail — a second one in 30 hours reads as pressure

Day 3	Tier A at 5 touches, zero response	Move to nurture. Drop tier-a, keep the durable tags, stop dialing
Day 3	Tier C	Standard blast. One SMS, one email, no calls
Day 3 → deadline	Everyone engaged	Conversations only. No new cold outreach into the same list
–24 hours	Engaged, no offer	The deadline stated as a fact, not a threat: date, time, and that you’re signing the best terms on the table

The move-to-nurture rule is deliberately mechanical — five touches, zero response, 48 hours. The judgment version (“keep going if it feels promising”) is how a day gets spent calling eight people who already decided. Nurture isn’t a graveyard: they keep their durable tags and come back into Tier A automatically the next time a deal matches their pattern.

Stop rule

Exhausted when **two** are true: ① A tier through five touches with a response rate under your baseline — until you have one, use zero replies ② three or more buyers independently naming the **same** objection ③ you’re dialing below the top 40% ④ two walkthroughs, no offers.

Then act on what the signal points at, not on effort:

- **Objection is price** → cut to the number they named, and re-run touch 1 to Tier A with the new price as the reason for the message. A price cut is the *only* legitimate reason to re-contact someone who ignored you.
- **Objection is scope or product** → the ranking was scored against the wrong scope class. Fix the outline, re-run the prompt. Data problem upstream, not a demand problem.
- **No objections, no replies, thin A tier** → widen the radius and re-run. The pool was too small from the start.
- **Objections are structural** — private road, failed septic, no legal access → reprice against what it actually is, or go back to the seller.

Three buyers naming the same objection is not three rejections. It’s one piece of market information delivered three times, and it’s the highest-value signal in the system. It’s also the one most often thrown away as “buyers being buyers.”

After the close — 45 minutes, on the calendar

1. Promote the durable tags. `dispo-412-oak-st`, `tier-a` and `radius-4mi` die with the deal. `scope-gut`, `fin-cash`, `buys- Dundalk` and the price band are true about the buyer until their behavior changes — keep those forever. After five deals your database self-segments before you export anything.

2. Record what the campaign taught you that the data couldn’t. Per contact: responded y/n and to which touch, walked y/n, offered y/n and at what number, and their objection in their words. A buyer who replies to SMS and never opens email is a fact you now own. A buyer who walked and objected on scope has told you their real box.

3. Note the winner — what they paid, what they said, how fast they moved, what they wanted in terms. Their next purchase is what you should be sourcing.

4. Append to one master buyer file outside the CRM, deduplicated on entity: entity, contact, phone, email, scope class, price band, submarket, financing, deals seen, responded to, walked, bought. After a handful of deals this beats a fresh export in any submarket you’ve worked, because it holds response behavior and an export never will.

5. Next deal in the corridor: run the prompt against the master file and a fresh export together. The master supplies behavior, the export supplies new entrants. Neither alone is as good as both.

§7 — VIDEO WALKTHROUGH

5–15 minutes. The goal is the transformation, not the software. Nobody buys this to learn where the export button is.

Beat	On screen	Say	Cut on
1. The problem (0:00–1:15)	Talking head, then a raw export scrolling — 140 unsorted rows	“This is 140 cash buyers. Three of them will buy this deal. Here’s how most people find out which three — they text all 140 and wait.” Then the cost: low replies, a list trained to ignore you, three real buyers buried	The scroll bar showing how far the list runs. Let it sit two seconds
2. The stack (1:15–2:00)	Four title cards	One sentence each. Say explicitly that the data source must carry transaction history , not just contacts — the most common setup mistake	The last card
3. The outline (2:00–3:30)	Fields being filled, then hard cut to two tabs showing conflicting square footage	Walk the fields at pace. Slow down on SF and show the discrepancy live: “Public record says 1,412. The 2019 listing says 1,806. If I rank on 1,412, I’m scoring buyers against a house that doesn’t exist”	The corrected field
4. Search and export (3:30–4:30)	Screen recording, radius widening, counter visible — 41, 68, 112	Why 100 is the floor. Why a wider radius is fine <i>because</i> the ranking re-sorts for it	The counter passing 100
5. The ranking (4:30–7:30) — the centerpiece	Prompt pasted, CSV attached, jump cut past the wait. Then split screen: raw export left, ranked output right. Same 140 people, different order	Narrate one buyer: “Row 96 in the raw export. Rank 3 ranked. Two guts within four miles in the last eight months, cash, same vintage.” Then the reverse: “Row 4 raw, because they’re closest. Tier C, because everything they’ve ever bought is turnkey rentals.” Then say the rule out loud: scope beats proximity	The split screen, held. Let the reorder land
6. CRM and the sequence (7:30–9:30)	Board sorted by fit score, then the three touches	Show that the board <i>is</i> the call list because Opportunity Value is the fit score. Show a real per-buyer SMS beside a generic blast, and the plain-text email beside a designer-built one. Don’t explain the difference — the comparison does it	The dialer opening the first card
7. The result (9:30–10:30)	Pipeline at end of day one, then one A-tier profile scrolling	What you hold at 5pm. [YOUR OWN DAY-ONE OUTCOME, OR CUT TO A DESCRIPTION OF THE DELIVERABLES] — don’t narrate a result you didn’t get	—
8. Lessons (10:30–12:00)	Talking head only. Screen recording dilutes this beat	① Public-record SF is the costliest error ② a thin A tier is information, not a problem to fix by loosening gates ③ the model over-indexes on distance unless you stop it ④ three buyers with the same objection is market data, not rejection. Close on the stop rule: “The list is exhausted before you feel like it’s exhausted. When it is, the answer is a price change or a wider radius — not more dials”	Black. No outro card, no music sting

Record on a real deal, not a demo. Blur seller info and buyer contact columns; leave transaction data visible — that’s the proof. The split screen in Beat 5 is your thumbnail and your first five seconds; lead the video with it as a cold open where the platform rewards it.
